Test Description	Value(s)	Unit(s)	Reference Range
------------------	----------	---------	-----------------

Drugs Of Abuse Urine: Nicotine / Cotinine

Nicotine - Cotinine Urine <i>LATERAL FLOW CHROMATOGRAPHIC IMMUNOASSAY</i>	Negative		Negative
--	----------	--	----------

Interpretation:
 NEGATIVE – DRUG CONCENTRATION IS BELOW THE DETECTABLE LEVEL
 POSITIVE - DRUG CONCENTRATION EXCEEDS THE DETECTABLE LEVEL

Nicotine’s major metabolite is cotinine which is oxidized in the liver by CYP2A6 (Cytochrome P450, Family 2, Subfamily A, Polypeptide 6) and is distributed in various body fluids including the blood, saliva and urine. Cotinine is the main biomarker which is used to distinguish tobacco users from non users and reflects the extent of exposure. Longer half-life of cotinine makes it a useful short-term marker of nicotine exposure. During tobacco smoking its level fluctuates relatively to lesser extent than other tobacco products
