

Patient Name : Mr MR.DUMMY

DOB/Age/Gender : 23 Y/Male

Patient ID / UHID : 8051899/RCL7248436

Referred By : Dr. Dr. X

Sample Type : Serum

Sample Collected : Apr 26, 2024, 01:00 PM

Report Date : May 25, 2024, 11:45 AM.

Barcode No : SI484550

Report Status : Final Report

Test Description	Value(s)	Unit(s)	Reference Range
------------------	----------	---------	-----------------

Treponema Pallidum Hemagglutination Assay (TPHA)

Treponema Pallidum Haemagglutination (TPHA) LATEX AGGLUTINATION (QUALITATIVE)	Negative		Negative
--	----------	--	----------

Interpretation:

Syphilis is a chronic infection that progresses through stages of infection, primary to quarternary. The typical symptoms initially are sores known as chancres, then syphilitic rash followed by long periods of dormancy. Untreated infection may result in cardiovascular problems and neurosyphilis. The infection is caused by the Spirochaete *Treponema pallidum*, and is usually acquired by sexual contact, although the disease may be transmitted by transfusion of infected blood. Intrauterine infection also occurs. The organism has proved virtually impossible to culture in artificial media and diagnosis of the infection usually depends on the demonstration of antibodies in the blood, which appear soon after initial infection.
