

Patient Name : Mr MR.DUMMY		Sample Collected : Apr 26, 2024, 01:00 PM	
DOB/Age/Gender : 23 Y/Male		Report Date : May 24, 2024, 10:32 AM.	
Patient ID / UHID : 8052339/RCL7248818		Barcode No : SI484198	
Referred By : Dr. X		Report Status : Final Report	
Sample Type : Serum			

Test Description	Value(s)	Unit(s)	Reference Range
------------------	----------	---------	-----------------

Helicobacter Pylori IgM Antibodies

Helicobacter Pylori-IgM (Serum, EIA)	0.47	Index	Negative: < 0.9 Equivocal: 0.9-1.1 Positive: > 1.1
---	------	-------	--

Interpretation:
 Helicobacter pylori (H.pylori) is a bacterium which is normally found in gastric mucosa. The organism is present in 95-98% of patients with duodenal ulcer and 60-90% of patients with gastric ulcers. Estimation of infection rate by various diagnostic tests including bacteriological, histo-logical and serological tests have revealed that 90% of symptomatic patients are affected and 50% of old age adults (> 50 years) is only colonized by bacteria lifelong without any clinical symptoms. Studies also have been demonstrated that removal of the organism by antimicrobial therapy is correlated with the resolution of symptoms and cure of diseases. Helicobacter pylori infection stimulates humoral immune response and provokes specific antibodies like IgG, IgM, and IgA.
